There is a read me file within the team_one folder.

We used html, CSS, JavaScript and NodeJS server for the backend. We communicated well as a team as we tried to implement a sports apparel storefront. This would require quite a bit of work as we were originally going to have five different sports, yet we almost completed three, baseball, football, and basketball. The other sports not fully implemented were Hockey and Soccer. We just ran out of time. We had the cart working with some teams as well as the checkout. The login page was done using a NodeJS server. We also communicated through zoom as well as sharing files through GitHub, which made our lives much better. We were hoping to get everything working by the end yet there are some major bugs and unfinished parts such as a functional search would have been a great implementation, as well as payment and credit card functionality. A database for products and user confirmation of purchase would have been great. Our site looks great, yet some of the functionality isn't there. In the end we learned quite a bit about building a website and some of us had no prior knowledge of how to do this. So, we are proud of what we accomplished.
